Feminist approaches within the social sciences have expanded enormously since the 1960s. In addition, in recent years, the social construction of knowledge has placed varied geographies at the centre of contemporary feminist and postmodern debates. Gender, Identity and Place is an accessible and clearly written introduction to the wide field of issues that academics, researchers and scholars within urban studies, urban geography, cultural geography and human geography need to understand in order to carry on relevant research. It is organized on the basis of spatial scale, examining the relationships between gender and place from the body to the nation, although the links between different spatial scales are also addressed. The comprehensive chronicle and spatial differentiation between the policies and practices of the new nation and the nation state and angering process has been a crucial part of the social construction of gendered differences and the corresponding, maintenance and reproducing dominant values between the social constructivist and feminism.

Feminist geography is a new way of thinking about data science and data ethics that is informed by the ideas of intersectional feminism. Today, on the one hand, and even more, on the other, data science and social science are shaped by gender, race, class, and sexuality. The narratives around big data and data science are overwhelmingly white, male, and heterosexual. Over time, we hope that the data science community will come to understand that it is not just a matter of more data or better data, but that data itself is shaped by gender, race, and sexuality. Data Feminism offers strategies for data scientists seeking to learn how feminism can help them work toward justice, and for feminists who want to focus their efforts on the growing field of data science. But Data Feminism is also about power, about who has it and who doesn’t, and about how those differentials of power can be challenged and changed.
